

GoCNScout × BamwoodChina: 60 天 X 英文成稿

本文件包含 60 天、每天 3 条可直接发布的英文内容，共 180 条。账号采用第一人称创始人口吻。Post A 是当天主内容；标记为 Thread 的内容要按编号逐条发布。方括号中的链接应在发布前替换为实际页面 URL 和 UTM 参数。

发布原则：不要把 exporter、exhibitor 或 database record 称为 verified factory；不要暗示数据库替代审厂、样品、认证、合同或付款核验；帖子中的统计数字应在发布当天再次从数据库核对。

Day 1 — Why I'm building these databases

Post A — Thread

1/5

I'm building two databases from more than 34,000 public Chinese exporter and exhibitor records.

Not because buyers need another giant list.

Because most supplier lists give you names. They don't help you decide where to start.

2/5

GoCNScout covers multiple industries, products and manufacturing regions.

I use it to study questions like:

- Which cities are relevant to this product?
- Which companies match the category?
- What public research signals are available?

3/5

BamwoodChina goes much narrower.

It focuses on bamboo, wood, grass, rattan, willow and related products, using product categories and customs registration records as research anchors.

4/5

Neither database tells you that a company is a good factory.

That conclusion still requires samples, document checks, audits, contracts and payment verification.

My goal is simpler: help buyers build a better starting list.

5/5

Over the next 60 days, I'll share what I find about Chinese manufacturing clusters, exporter data and supplier research.

If you source physical products, tell me what you're working on. I may use it for a future breakdown.

Post B — Short

One distinction I'll repeat often:

An exhibitor record is not a factory audit.

A customs registration number is not a quality certificate.

A supplier database is a research starting point—not the end of due diligence.

Post C — Engagement

What are you sourcing right now?

Reply with the product, not just the industry.

"Stainless-steel bottle" is much more useful than "homeware."

I'll pick a few replies for future China sourcing breakdowns.

Day 2 — Start with the cluster

Post A — Short + visual

I used to think supplier research started with company names.

Now I usually start with the product and the manufacturing cluster.

The right city can put component suppliers, tooling, finishing, packaging and logistics within the same regional network.

That does not guarantee a good supplier. It gives you a more relevant place to look.

Post B — Short

"Made in China" is too broad to be useful sourcing information.

The better question is:

Where in China is this specific product—and its upstream supply chain—concentrated?

Post C — Poll

When starting supplier research, what do you look for first?

- Product specialization
- Manufacturing city
- Lowest quotation

- Existing certifications

I usually begin with the first two, then verify the rest.

Day 3 — What BamwoodChina actually contains

Post A — Short + data card

I built BamwoodChina around 14,141 records for Chinese exporters of bamboo, wood, grass, rattan, willow and related plant-based goods.

The useful part is not the row count.

It is the ability to narrow records by product category, material and customs district before doing deeper research.

Post B — Short

A customs registration number can help you identify and cross-check an exporter record.

It cannot tell you:

- Current capacity
- Product quality
- Factory ownership
- Certification validity
- Whether the company fits your order

I treat it as one useful identifier, not a verdict.

Post C — Engagement

Which plant-based product category should I analyze first?

- A. Bamboo kitchenware
- B. Wooden furniture
- C. Rattan and woven goods
- D. Plywood and panels

Day 4 — Six research signals

Post A — Thread

1/7

Before I contact a Chinese supplier, I want at least six research signals.

None proves the company is right for the order. Together, they help me ask better questions.

2/7 — Product fit

Does the company appear focused on the product I need, or does its catalog cover ten unrelated categories?

Broad catalogs are not automatically bad, but they change what I need to verify.

3/7 — Location

Is the company located near a relevant manufacturing cluster?

Location can suggest access to materials, components and skilled labor. It does not prove production ownership.

4/7 — Business scope and company type

What is the company registered to do?

I compare the public business description with the products being offered and note inconsistencies for follow-up.

5/7 — Website and product evidence

Does the website show a coherent product range, consistent company identity and useful production information?

A website is evidence to inspect—not proof by itself.

6/7 — Exhibition or customs records

These records can help establish identity and history.

They do not replace current operational checks.

7/7 — Independent verification

Before money moves, I still want samples, document verification, a clear contract, bank-account matching and—when the risk justifies it—an audit or inspection.

Save this as a starting checklist.

Post B — Short

I don't score suppliers from one field.

Registered capital, location, website, exhibition history and product range are all incomplete signals.

The useful question is whether several independent signals tell a consistent story.

Post C — Engagement

Which supplier signal do you find hardest to verify remotely?

I'm especially interested in answers from buyers who cannot visit China before ordering.

Day 5 — A trading company is not always the wrong choice

Post A — Short

I don't automatically reject a supplier because it may be a trading company.

For a large, specialized order, factory-direct can make sense.

For lower MOQs, mixed products or coordination across several factories, a capable trading company may be the better partner.

The problem is not the business model. It is pretending to be something else.

Post B — Short

A broad catalog can be a clue that a company trades rather than manufactures.

But I would never make that judgment from the catalog alone.

I'd compare the business scope, address, product evidence, quotation detail and willingness to support an audit.

Post C — Poll

For your next order, which would you prefer?

- Factory direct
- Trading company
- Sourcing agent
- Depends on MOQ and product

My answer is almost always the last one.

Day 6 — Customs-district concentration

Post A — Data visual caption

I mapped BamwoodChina's 14,141 exporter records across 39 customs districts.

The largest concentrations in the current dataset include Hangzhou, Qingdao, Fuzhou and Nanjing customs.

Important caveat: a customs district is an administrative research field. It is not the same thing as a precise factory location.

[Attach current customs-district chart]

Post B — Short

One mistake I see in data analysis is turning an administrative region into a manufacturing claim.

If a record belongs to a customs district, I still need the company's actual location and operating evidence before drawing conclusions about its production base.

Post C — Engagement

Would this be useful as a recurring series?

"One product category, mapped across Chinese customs districts."

If yes, reply with the category you want first.

Day 7 — Why data cleaning is difficult

Post A — Short

The hardest part of cleaning 34,000+ Chinese company records was not translation.

It was knowing when not to fill a blank.

AI can normalize categories and suggest translations. It can also produce a confident answer where the source provides none.

In supplier research, "unknown" is often safer than invented precision.

Post B — Short

My basic rule for enrichment:

If I cannot trace a field back to a source or a clearly defined transformation, it should not appear as a fact.

That makes the database less impressive in screenshots—and more useful in real decisions.

Post C — Engagement

Which error would damage your trust in a supplier database most?

- Wrong company identity
- Wrong product category
- Outdated website
- Unsupported "verified" label

Day 8 — Choosing a manufacturing city

Post A — Thread

1/6

When I research a new product in China, I don't begin by searching the whole country.

I first build a shortlist of relevant manufacturing regions.

Here is the process I use.

2/6

First, define the product narrowly.

“Lighting” is too broad.

An LED driver, decorative pendant light and industrial floodlight may belong to different supplier networks.

3/6

Next, look for repeated geographic signals across exhibitor records, supplier websites, trade data and industry sources.

One directory can be wrong. Repeated concentration is more meaningful.

4/6

Then ask what the cluster actually provides:

- Components
- Tooling
- Finishing
- Packaging
- Skilled labor
- Port or freight access

5/6

Only then do I compare individual companies.

Being in the right cluster is not enough. I still check product fit, identity, documents, samples and operational evidence.

6/6

Cluster-first research reduces noise. It does not remove due diligence.

I’m building city and industry pages in GoCNScout to make this first step easier.

[GoCNScout cities URL]

Post B — Short

A famous manufacturing city is not automatically the best place for every product.

I care less about the city’s brand and more about whether the local supplier network matches the exact product and process.

Post C — Engagement

Name one product and one Chinese city you associate with it.

I'll check whether the data supports the association or suggests another cluster.

Day 9 — Bamboo is not one category

Post A — Short

I would not search for a generic "bamboo supplier."

Bamboo furniture, kitchen utensils, woven baskets and packaging involve different processes, equipment and compliance questions.

The material is only one filter. The product and production process matter more.

Post B — Short

Two suppliers can both claim to make bamboo products while having almost no overlap in capability.

One laminates boards. Another weaves strips. Another buys finished blanks and adds branding.

That is why I separate material tags from product categories in BamwoodChina.

Post C — Engagement

If you were buying bamboo products, which detail would you want before asking for a quote?

- Exact material/species
- Production process
- Food-contact compliance
- MOQ and customization

Day 10 — Reading a city ranking correctly

Post A — Data visual caption

I mapped the current GoCNScout records for one product category by city.

This chart shows where relevant public records are concentrated in this dataset—not which city has the "best factories."

I use rankings like this to decide where to investigate first, then verify companies individually.

[Attach current industry-by-city chart and replace this line with the category]

Post B — Short

Whenever I publish a supplier ranking, I ask three questions:

1. What is being counted?
2. What time period does it cover?
3. What conclusion does the data not support?

Without those answers, a precise chart can still mislead.

Post C — Engagement

Which city breakdown should I publish next?

- Auto parts
- LED lighting
- Machinery
- Furniture

Day 11 — Factory or trader framework

Post A — Thread

1/6

“Factory or trading company?” sounds like a simple question.

In practice, I treat it as a hypothesis to test—not a label I can infer from one database field.

2/6

I start with product concentration.

Does the company focus on a coherent family of products, materials and processes?

An unrelated catalog raises questions, but it does not settle the answer.

3/6

Then I compare its registered business scope and address with what it claims to manufacture.

An industrial address is useful context. It is not proof of ownership.

4/6

I look for process evidence:

- Equipment relevant to the product
- Quality-control steps
- Engineering detail
- Consistent factory imagery
- Audit availability

Stock photos do not count.

5/6

During quotation, I watch how the company handles technical questions.

Can it explain materials, tolerances, tooling, failure modes and lead-time assumptions?

Specific answers are more useful than a factory badge.

6/6

Finally, I verify through samples, documents and—when justified—an independent audit.

The goal is not to avoid every trader. It is to understand who will actually control production and quality.

Post B — Short

I'm cautious when a supplier insists it owns a factory but avoids every question about equipment, process control and audit access.

The label matters less than operational transparency.

Post C — Case question

A supplier sells furniture, lighting, kitchenware and pet products under one catalog.

What would you check next before deciding it is a trading company?

Day 12 — A useful shortlist is narrow

Post A — Short

I would rather receive 30 relevant exporters than 4,000 loosely related rows.

A useful shortlist should reflect:

- Exact product
- Material
- Target market
- MOQ
- Required process
- Compliance needs

Volume is easy. Relevance is the work.

Post B — Short

"Wood products" can include furniture, plywood, flooring, doors, packaging, crafts and pet products.

If a database sells all of that as one ready-to-use sourcing list, the buyer still has most of the research left to do.

Post C — Engagement

Give me a sourcing brief in one sentence:

Product + target market + approximate MOQ + one non-negotiable requirement.

I'll show how I would turn it into database filters.

Day 13 — Exhibition history

Post A — Short

I use exhibition history as a research signal, not an endorsement.

Repeated participation may support questions about continuity and market activity.

It does not prove that the exhibitor owns a factory, has current capacity or can meet your quality requirements.

Post B — Short

If a company appeared at a trade fair five times, I still want to know:

- What did it exhibit?
- Was the legal entity consistent?
- Does the current product range match?
- Can it support samples and an audit now?

Historical presence is context, not clearance.

Post C — Poll

Do you check a supplier's trade-fair history before contacting it?

- Always
- Sometimes
- Never
- I didn't know this was possible

Day 14 — Seven lessons from the first two weeks

Post A — Thread

1/8

Seven supplier-research lessons I keep coming back to while building GoCNScout and BamwoodChina:

2/8

1. Start with a narrowly defined product.

Broad categories produce broad, noisy lists.

3/8

2. Map relevant manufacturing clusters before comparing individual companies.

Geography can improve the starting pool, but it does not verify a supplier.

4/8

3. Never decide “factory or trader” from one field.

Look for consistency across multiple independent signals.

5/8

4. Customs and exhibition records help establish identity and history.

They do not certify quality or capability.

6/8

5. A smaller, criteria-based shortlist is usually more actionable than a huge spreadsheet.

7/8

6. Missing data should stay missing until it can be sourced.

7. No database replaces samples, audits, contracts and payment controls.

8/8

I’m documenting the research process as I build these products.

Follow if you work with Chinese suppliers—or reply with the part of sourcing that takes you the most time.

Post B — Short

The biggest shift in my thinking:

I no longer ask, “How many suppliers can I find?”

I ask, “How quickly can I remove the obviously irrelevant ones without inventing confidence?”

Post C — Engagement

What should next week focus on?

- Building a shortlist
- Checking supplier websites
- Sample-order questions
- Payment and fraud controls

Day 15 — From 100 names to 10 candidates

Post A — Thread

1/7

If I had 100 possible Chinese suppliers and needed 10 candidates, this is how I would reduce the list.

I would not begin by requesting 100 quotations.

2/7

First, write the non-negotiables:

- Exact product and material
- Target market
- MOQ range
- Required process
- Mandatory certification or test standard

3/7

Second, remove obvious product mismatches.

I compare the public product description, website and business scope. If the company only loosely touches the category, it leaves the list.

4/7

Third, group by manufacturing region.

I want to know whether candidates sit inside a relevant supply network or appear isolated from it.

5/7

Fourth, check identity and consistency:

- Legal company name
- Website identity
- Public records
- Product evidence
- Available history

6/7

Fifth, send a focused qualification request—not a generic “best price” email.

I ask questions that reveal process knowledge, capacity assumptions and willingness to share evidence.

7/7

Only then do I order samples or arrange deeper verification.

The database helps me build the longlist. The buying process decides who survives it.

[GoCNScout database URL]

Post B — Short

The cheapest way to improve supplier research is often to write better exclusion rules.

If a candidate fails a non-negotiable requirement, I remove it before spending time on quotations and calls.

Post C — Engagement

What is your first exclusion rule when screening a new supplier?

Mine depends on the product, but obvious product-process mismatch is usually near the top.

Day 16 — Payment-detail changes

Post A — Short

If a supplier changes its bank details just before payment, I stop the transfer.

I verify the request through a second communication channel, confirm the beneficiary matches the contracting entity and investigate why the change occurred.

One delayed payment is cheaper than sending money to the wrong account.

Post B — Short

Email is not enough for verifying a last-minute bank-account change.

The supplier's mailbox may be compromised even when the message looks normal.

I use a previously verified phone or video contact and document the confirmation.

Post C — Engagement

What is your company's process when supplier bank details change?

If the answer is "reply to the same email," it may be time to add a second-channel check.

Day 17 — BamwoodChina category distribution

Post A — Data visual caption

I grouped BamwoodChina's current exporter records into practical buyer categories: furniture, panels/flooring/doors, crafts, kitchenware, woven goods, pet products, packaging and outdoor/garden.

The purpose is not to make the dataset look tidy. It is to turn inconsistent source descriptions into useful starting filters.

[Attach a freshly generated category chart]

Post B — Short

Classification always loses some detail.

That is why I keep the original product description alongside the normalized category.

The category helps you search. The source text helps you inspect what the company was actually listed for.

Post C — Engagement

Which BamwoodChina category deserves a narrower paid research pack first?

- Furniture
- Panels and flooring
- Woven goods
- Kitchenware

Day 18 — A website found is not a website verified

Post A — Short

In GoCNScout, “official website found” means a relevant company website was identified in the source or research process.

It does not mean I have verified every claim on that website.

Before relying on it, I compare the domain, legal entity, product range and contact identity.

Post B — Short

A polished supplier website can still belong to a trader, an inactive company or a different legal entity.

I care about consistency more than design:

Does the name, address, product evidence and company identity line up?

Post C — Case question

A website looks professional, but the footer company name differs from the quotation.

Would you:

- A. Ignore it
- B. Ask for clarification
- C. Stop immediately
- D. Verify both entities first

I would start with D.

Day 19 — Seven questions before samples

Post A — Thread

1/7

Before I pay for a sample, I want answers to seven questions.

A good sample is useful. A good sample from the wrong process is not.

2/7

1. Is the sample made by the same facility and process intended for mass production?
2. Are the material and components identical to the proposed production specification?

3/7

3. Which parts are stock and which are customized?
4. What will change between sample and production—tooling, finish, packaging or tolerances?

4/7

5. Who pays for revisions if the sample misses the agreed specification?

I want this understood before the first sample arrives.

5/7

6. Which tests or documents are required for the target market?

I do not assume an existing report covers my exact model, material or date range.

6/7

7. What is the approval record?

Photos are useful, but a signed specification, approved sample and revision history are stronger controls.

7/7

The sample stage is not just about appearance.

I use it to test how the supplier communicates, documents changes and controls the path to production.

Post B — Short

A perfect hand-made sample can create false confidence if mass production uses a different process.

I always ask what will be identical—and what will change—when the order scales.

Post C — Engagement

What is the most expensive sample mistake you have seen?

Wrong material, wrong dimensions, wrong finish—or a sample that could not be reproduced in production?

Day 20 — Customs registration: useful, limited

Post A — Short

I built BamwoodChina around customs-registered exporter records because a stable identifier is more useful than an anonymous marketplace profile.

But I would never describe that identifier as proof of factory quality.

It helps answer “which entity is this?”—not “should I place an order?”

Post B — Short

What I can do with a customs registration number:

- Identify a record
- Cross-check company information
- Reduce name ambiguity

What I cannot do with it:

- Confirm current capacity
- Confirm certification
- Guarantee product compliance

Post C — Engagement

Before today, what did you think a Chinese customs registration number proved?

I’m considering a plain-English guide that separates registration, certification and factory verification.

Day 21 — Why I leave fields blank

Post A — Short

I would rather show a blank field than a confident guess.

When I cannot verify an English company name, website or classification from the source and defined rules, I do not want AI quietly turning uncertainty into a fact.

Incomplete data is visible. Fabricated certainty is harder to detect.

Post B — Short

The most dangerous database errors are plausible ones.

A completely broken record gets noticed.

A believable but incorrect company match can survive several decisions before anyone checks it.

Post C — Engagement

Would you rather a supplier database:

- A. Show fewer fields with clear provenance
- B. Fill every field, even when some are inferred

I’m firmly in camp A.

Day 22 — Bamboo kitchenware research

Post A — Thread

1/7

If I were sourcing bamboo kitchenware from China, I would not start by emailing 100 generic “bamboo suppliers.”

I would narrow the problem first.

2/7

I would define the exact product:

- Cutting board
- Utensil
- Storage item
- Serving tray
- Disposable food-contact item

Each can involve different processes and compliance questions.

3/7

Then I would define material construction.

Is it solid bamboo, laminated bamboo, bamboo fiber composite or another material marketed with “bamboo” in the name?

4/7

Next, I would document the target market and food-contact requirements.

I would not accept “food grade” as a complete answer. I would ask which material, model and test standard the evidence covers.

5/7

Then I would use BamwoodChina to build a longlist by product description, material and customs district.

That list still needs website, identity and capability research.

6/7

Before sampling, I would clarify adhesives, coatings, moisture control, packaging and production consistency.

Those details matter more than a generic eco-friendly claim.

7/7

The database gets me from “China” to a researchable group of exporters.

The specification and verification process gets me from that group to a buying decision.

[BamwoodChina relevant category URL]

Post B — Short

“Bamboo kitchenware” is still too broad for a serious supplier search.

A coated utensil, laminated board and food-storage product may need different materials, processes and test evidence.

I narrow the product before I widen the search.

Post C — Poll

Which bamboo kitchenware product should I break down next?

- Cutting boards
- Utensils
- Storage
- Serving trays

Day 23 — Wooden pet products

Post A — Short + data card

Wooden pet products are a relatively narrow category in BamwoodChina, but that can make the intent more useful.

A buyer looking for cat furniture or wooden pet housing does not need thousands of generic wood exporters.

They need a smaller pool with relevant product evidence.

[Attach current pet-products count after verification]

Post B — Short

For wooden pet products, I would screen for more than woodworking capability.

I would also ask about stability, coatings, odor, cleanability, load testing, packaging size and assembly instructions.

The end user may be an animal, but the buyer’s quality obligations are still human.

Post C — Engagement

Which wooden pet category has the strongest sourcing demand in your market?

- Cat trees
- Pet houses
- Feeding stations
- Small-animal habitats

Day 24 — The “verified supplier” problem

Post A — Short

I avoid the phrase “verified supplier” unless I can explain exactly what was verified, by whom and when.

Identity verified?

Factory ownership verified?

Certification verified?

Production quality verified?

One vague badge should not collapse four different questions.

Post B — Short

When a platform says “verified,” I look for the verification scope.

A business license check may confirm the legal entity. It does not confirm capacity, quality systems or whether the supplier can make my product.

Post C — Engagement

What should a “verified supplier” label have to disclose?

My minimum: verifier, date, scope, evidence and expiration.

Day 25 — Rattan, willow and grass-woven sourcing

Post A — Thread

1/6

Rattan, willow, bamboo and grass-woven products often appear together in sourcing searches.

I would not treat them as interchangeable.

2/6

The material affects flexibility, strength, finish, moisture behavior and appearance.

The same basket design can behave differently when the material changes.

3/6

The production model matters too.

Some work may be factory-based. Some may rely on distributed hand-weaving networks with different consistency and capacity controls.

4/6

I would specify:

- Material and treatment
- Dimensions and tolerance
- Moisture requirements
- Color variation limits
- Load expectations
- Packaging method

5/6

Then I would build a longlist from relevant product and material records—not from a generic “natural homeware” search.

After that comes sample comparison and process verification.

6/6

Natural materials vary. That does not mean quality standards should be vague.

The specification needs to define which variation is acceptable and which is a defect.

Post B — Short

“Handmade” should not be used as an excuse for uncontrolled dimensions, moisture or load performance.

Natural variation can be part of the design. Functional requirements still need measurable limits.

Post C — Engagement

When buying woven goods, which problem causes the most returns?

- Shape variation
- Mold or moisture
- Breakage
- Color inconsistency

Day 26 — A list is not a strategy

Post A — Short

A supplier list is not a sourcing strategy.

It becomes useful only when paired with:

1. Clear requirements
2. Screening rules
3. Qualification questions
4. Samples and independent verification

Without those steps, a larger list creates more work.

Post B — Short

I think of supplier data as a funnel:

Database → longlist → qualified shortlist → samples → verified production partner.

Most expensive mistakes happen when someone jumps from the first step to the last.

Post C — Engagement

Which stage takes your team the longest?

- Finding names
- Qualifying companies
- Comparing samples
- Verifying before production

Day 27 — Furniture by customs district

Post A — Data visual caption

I mapped the current BamwoodChina furniture records by customs district.

This is useful for seeing where records cluster administratively. It is not a map of factory addresses, output or quality.

I use it to form regional questions—not to rank “best suppliers.”

[Attach freshly verified furniture × customs-district chart]

Post B — Short

A customs-district chart becomes much more useful when paired with actual city, company and product evidence.

Administrative concentration tells me where to investigate. It does not tell me where production occurs.

Post C — Engagement

Would you rather see the next chart for:

- Plywood
- Bamboo products
- Woven baskets
- Wooden crafts

Day 28 — Opening shortlist research

Post A — Soft sales post

Over the last four weeks, I've been turning broad sourcing questions into narrower research filters.

I'm opening a small number of custom shortlist research slots for bamboo, wood and related products.

You provide the product, target market, MOQ and non-negotiables. I use the database to build a research starting list—not a factory endorsement.

[BamwoodChina inquiry URL]

Post B — Short

What I would include in a useful shortlist brief:

- Exact product
- Material/process
- Target country
- Approximate quantity
- Required certification or test
- Must-have customization

"Need bamboo supplier" is not enough to do good research.

Post C — Engagement

If you are actively sourcing a bamboo or wood product, reply "brief" and the product name.

I'll share the information I would need before starting a shortlist.

Day 29 — Mapping a category to cities

Post A — Thread

1/6

Here is how I map a product category to Chinese cities before screening companies.

It is one of the most useful things I can do with GoCNScout's structured records.

2/6

I begin with exact product keywords, including common synonyms and process terms.

Broad industry labels are useful for navigation but weak for serious analysis.

3/6

I group matching records by city and province, then check whether concentration remains after obvious classification errors are removed.

Raw counts need cleaning before interpretation.

4/6

I compare the leading locations with external industry knowledge:

Do those regions have the relevant components, materials, skilled labor and logistics?

5/6

Then I inspect representative companies from each cluster.

I want to see whether the concentration reflects real specialization or just broad category tagging.

6/6

The result is not "the best city."

It is a smaller set of places where supplier research is more likely to be productive.

[GoCN Scout products or cities URL]

Post B — Short

I do not trust a city ranking until I inspect the records behind the top positions.

A classification error repeated 200 times becomes a convincing—but wrong—chart.

Post C — Engagement

Reply with a product you want mapped.

I'll prioritize products specific enough to produce a meaningful city comparison.

Day 30 — One high-value industry map

Post A — Data visual caption

Today I'm publishing a GoCN Scout city breakdown for **[insert verified industry]**.

The chart measures matching records in the current database. It does not measure factory output, quality or export value.

My practical takeaway: start deeper research in the top clusters, but compare companies on product fit and current evidence.

[Attach freshly generated chart]

Post B — Short

The best chart caption is sometimes the sentence that limits the chart.

This one shows record concentration—not capacity, revenue or supplier quality.

I would rather narrow the claim than oversell the data.

Post C — Engagement

For next month, which GoCNScout series should become weekly?

- Product → city maps
- Factory vs trader research
- Supplier website checks
- Database-building lessons

Day 31 — Using public supplier data responsibly

Post A — Long-form post

I use public supplier data to reduce uncertainty—not to manufacture certainty.

Before I contact a company, structured records can help me understand its product category, location, public history and available identifiers. That is valuable because it turns a blank search box into a researchable longlist.

But every record has a boundary.

An exhibitor record tells me that an entity appeared in an exhibition source. A customs registration number helps me identify an exporter record. A website shows what a company chooses to publish. None of those facts proves current capacity, factory ownership, product quality or compliance with my target market.

My workflow is therefore layered:

1. Use databases to discover and organize candidates.
2. Cross-check identity and product fit across independent sources.
3. Ask technical questions that expose process knowledge.
4. Verify documents against the exact legal entity and product.
5. Approve samples against a written specification.
6. Use audits or inspections when the order risk justifies them.
7. Match contracts and bank beneficiaries before payment.

Good supplier data saves research time. Good procurement controls protect the transaction.

I'm building GoCNScout and BamwoodChina around that distinction.

Post B — Short

I don't want a database to make the buying decision for me.

I want it to show me where to investigate, what evidence exists and which questions remain unanswered.

That is a more modest promise—and a more useful product.

Post C — Engagement

Which part of supplier research would you trust a database to handle?

And which part would you always keep human?

Day 32 — Registered capital

Post A — Short

I treat registered capital as context, not proof of factory ownership.

A larger figure may be consistent with a capital-intensive operation. It can also be historical, subscribed rather than fully paid, or unrelated to the specific facility being presented.

I never let one number answer an operational question.

Post B — Short

If I want to know whether a supplier controls production, I ask for production evidence:

- Relevant equipment
- Process flow
- Capacity assumptions
- Quality records
- Audit access

Registered capital does not replace any of these.

Post C — Case question

Company A has high registered capital but weak product evidence.

Company B is smaller but answers every technical question clearly and accepts an audit.

Which one would you investigate first—and why?

Day 33 — Factory vs trader: choosing, not judging

Post A — Thread

1/6

I don't ask "factory or trading company?" because one is always good and the other is always bad.

I ask because the answer changes how I manage the order.

2/6

Factory-direct can be attractive when:

- The product is specialized
- Volume is meaningful
- Engineering control matters
- I can manage communication and quality directly

3/6

A trading company may be useful when:

- I need mixed products
- MOQs are smaller
- Several factories must be coordinated
- I value consolidation and communication support

4/6

The risk appears when the commercial role is hidden.

If a trader claims to own production, I may misunderstand pricing, capacity, intellectual-property exposure and who controls corrective action.

5/6

So I verify the operating model and write responsibilities into the agreement.

Who buys materials? Who approves subcontractors? Who owns tooling? Who fixes defects?

6/6

I choose the model that fits the order.

Transparency matters more than the label.

Post B — Short

Factory-direct is not automatically cheaper after you include coordination, quality failures, consolidation and management time.

I compare total execution risk—not just unit price.

Post C — Engagement

For a five-SKU order with modest volume, would you prefer five factories or one capable trading partner?

What would decide it for you?

Day 34 — Bamboo furniture is its own search

Post A — Short

I would not treat bamboo furniture as a simple subset of wooden furniture.

Material construction, lamination, moisture behavior, load performance and finishing can differ.

The product may share a category while requiring a different supplier-screening brief.

Post B — Short

For bamboo furniture, I would ask how the board or component is made—not just whether the surface looks like bamboo.

The material description needs to match the construction, adhesive system and testing plan.

Post C — Engagement

If I build a bamboo-furniture shortlist template, which product should it use?

- Shelving
- Tables
- Chairs
- Bathroom furniture

Day 35 — Two databases, two anchors

Post A — Thread

1/6

I'm building two supplier databases, but they start from different kinds of evidence.

That difference changes what each product is good for.

2/6

GoCNScout starts from broad exhibitor and supplier research records across many industries.

Its strength is discovery by product, industry, city and public company signals.

3/6

BamwoodChina starts from a narrower set of customs-registered exporter records for bamboo, wood, grass, rattan, willow and related products.

Its strength is vertical focus and entity identification.

4/6

An exhibition record can support research into market participation and product presentation.

A customs record can support identity and exporter-record cross-checking.

Neither proves factory quality.

5/6

This is why I do not merge every field into one mysterious “supplier score.”

Different evidence answers different questions.

6/6

The product design I trust most is transparent about both value and limits.

GoCNScout helps with broad discovery. BamwoodChina helps with a focused plant-based exporter search.

Post B — Short

More data is not automatically better data.

The useful question is whether the dataset matches the decision you are trying to make.

Post C — Engagement

Which would you use first?

A. Broad multi-industry discovery

B. Narrow exporter records for one material category

The product determines my answer.

Day 36 — GoCNScout search walkthrough

Post A — Demo caption

I recorded how I turn one product keyword into a research longlist in GoCNScout.

My sequence is:

1. Search the exact product
2. Inspect related product terms
3. Compare city and industry concentration
4. Remove obvious mismatches
5. Open individual public profiles
6. Save candidates for independent verification

This is discovery—not a recommendation engine.

[Attach screen recording and database URL]

Post B — Short

When a search returns too many suppliers, I do not add random filters.

I return to the buying requirement and ask which condition would actually disqualify a company.

Useful filters come from the specification.

Post C — Engagement

Send me a product keyword.

I'll reply with the first two filters I would add before reviewing companies.

Day 37 — BamwoodChina filter walkthrough

Post A — Demo caption

Here is how I use BamwoodChina to narrow plant-based exporter records:

Product category → material → customs district → source description → individual record.

The result is a research longlist. I still need to find current operating evidence before contacting or buying.

[Attach screen recording and BamwoodChina database URL]

Post B — Short

I keep both normalized categories and raw source descriptions in BamwoodChina.

The normalized field makes filtering possible.

The raw field lets the buyer see what the original record actually said.

Post C — Engagement

Which filter would be most useful for your product?

- Material
- Product category
- Customs district
- Exact source description

Day 38 — Checking a supplier website

Post A — Thread

1/7

I can learn a lot from a supplier website in ten minutes—if I look beyond the homepage.

Here is my quick check.

2/7

First, identity.

Does the company name in the footer, contact page and legal documents match the entity sending the quotation?

3/7

Second, product coherence.

Do the products share materials, processes and customer types, or does the site look assembled from unrelated catalogs?

4/7

Third, process evidence.

I look for specific equipment, quality steps, engineering detail and factory information—not generic claims and stock photography.

5/7

Fourth, consistency.

Do addresses, phone codes, email domains, certificates and company names tell the same story?

6/7

Fifth, freshness.

Are product pages, news, certificates and copyright dates current enough to support further research?

7/7

A website can move a supplier forward or raise new questions.

It never replaces document verification, samples or an audit when the risk requires one.

Post B — Short

I am more impressed by one page explaining a real production process than by 100 polished product pages with no technical detail.

Specificity is harder to fake consistently.

Post C — Engagement

What is the first page you open on a supplier website?

I usually check Contact/About for identity, then products and process evidence.

Day 39 — Exclusion filters

Post A — Short

One of my favorite database features is not a discovery filter. It is an exclusion filter.

If the company's product evidence, region or business model clearly conflicts with a non-negotiable requirement, I want it out of the review queue early.

Post B — Short

Good sourcing is partly the discipline of saying “not enough fit” before a salesperson convinces you otherwise.

I write exclusion rules before I look at company profiles.

Post C — Engagement

Complete this sentence:

“I immediately remove a supplier from my longlist when...”

Day 40 — Material tags

Post A — Data visual caption

I mapped material tags across BamwoodChina’s current records: bamboo, wood, grass, rattan, willow, reed and combinations.

One exporter record may carry several tags because source descriptions often include multiple materials.

This chart describes classification frequency—not production volume.

[Attach freshly verified material-tag chart]

Post B — Short

Multi-material products are one reason simple supplier categories fail.

A rattan basket may include a metal frame, textile liner and wooden handle.

The headline material does not describe the whole supply chain.

Post C — Engagement

Which mixed-material product is hardest for you to source consistently?

I’m looking for examples where one component repeatedly causes quality problems.

Day 41 — Turning a vague request into filters

Post A — Thread

1/6

Example sourcing request:

“I need an eco-friendly bamboo product supplier.”

I cannot build a useful shortlist from that sentence. Here is how I would refine it.

2/6

First: What product?

Let's say a laminated bamboo bathroom shelf. Now I can think about construction, load and moisture exposure.

3/6

Second: Which market and use environment?

Indoor bathroom use in the EU creates different documentation and performance questions than a decorative shelf for another market.

4/6

Third: What is non-negotiable?

Dimensions, load, coating, adhesive requirements, packaging test, MOQ and target cost all influence the supplier pool.

5/6

Fourth: Which database filters follow from the brief?

Product category, bamboo/wood material tags and relevant source descriptions create the first longlist.

6/6

Then comes evidence: current website, process capability, documentation, sample and verification.

Better input produces a better shortlist.

Post B — Short

"Eco-friendly" is not a sourcing specification.

I need to know the material, claim, evidence, target market and product life cycle behind the word.

Post C — Engagement

Send me your vaguest sourcing request.

I'll rewrite one into a filter-ready brief.

Day 42 — Static spreadsheets

Post A — Short

Static supplier spreadsheets become less useful when nobody records what changed.

Websites move, companies close, product focus changes and categories drift.

I avoid quoting a universal "decay rate." I focus on version date, source provenance and a repeatable update process.

Post B — Short

A supplier CSV should answer:

- When was it created?
- From which source?
- Which fields were transformed?
- Which fields were independently checked?
- How are corrections handled?

Without that, a large file has no operating context.

Post C — Engagement

How often does your team revisit its approved or prospective supplier list?

- Monthly
- Quarterly
- Annually
- Only when something goes wrong

Day 43 — Why not just use Google or Alibaba?

Post A — Thread

1/6

Why use a supplier database when Google and Alibaba already exist?

I use all three. They solve different parts of the research problem.

2/6

Marketplaces are useful for discovering active commercial offers, communicating and comparing visible products.

Their ranking and profile systems also shape what I see.

3/6

Google is useful for websites, news, documents and cross-checking identity.

It is flexible, but the results are not structured around my sourcing workflow.

4/6

A structured database lets me filter and compare records consistently across product, region and available company signals.

It is strongest at longlist creation and pattern discovery.

5/6

Then I cross-check the candidates elsewhere.

No single channel has complete or perfectly current information.

6/6

My workflow is database for structure, search for verification, marketplace for commercial context—and independent due diligence before buying.

The tools are complements, not religions.

Post B — Short

The advantage of a structured database is not that every field is automatically true.

It is that I can apply the same questions across many companies and see where evidence is missing.

Post C — Engagement

Where did you find your best current supplier?

- Trade fair
- Marketplace
- Google
- Referral
- Sourcing agent

Day 44 — Category packs vs giant lists

Post A — Short

If I sell a category pack, I want it to save a buyer from sorting thousands of irrelevant rows.

That means the pack should be specific enough to match a real purchasing task—not just “all wood companies.”

I’m testing smaller product-focused packs before assuming bigger is better.

Post B — Short

A useful data pack needs more than records.

It needs:

- Clear inclusion rules
- Field definitions
- Source and version date
- Known limitations
- A suggested next-step workflow

Post C — Engagement

Which would you pay for?

- A. 4,000 broad furniture records
- B. 100 records matched to one furniture type
- C. 25 manually researched candidates

The answer helps me design BamwoodChina products.

Day 45 — Website coverage by industry

Post A — Data visual caption

I compared the share of GoCNScout records with an identified official website in **[verified industry]**.

This is a coverage metric, not a quality score.

“Website found” means there is another public source to inspect. It does not mean every claim on the site has been verified.

[Attach freshly verified chart]

Post B — Short

No website is a research disadvantage, but not always an automatic rejection.

Some capable exporters have weak English web presence. I adjust the verification path rather than pretending the missing evidence does not matter.

Post C — Engagement

Would you contact a supplier with no identifiable official website?

What alternative evidence would you require first?

Day 46 — Ten due-diligence red flags

Post A — Thread

1/7

Ten supplier red flags that make me slow down and verify more deeply.

None automatically proves fraud. Each one changes the level of evidence I require.

2/7

1. Bank beneficiary does not match the contracting entity.
2. Last-minute payment-account change.

3. Company names differ across quotation, website and documents.

3/7

4. Product catalog spans unrelated processes with no clear operating explanation.

5. Technical questions receive only sales language.

6. The supplier avoids live process evidence or audit access.

4/7

7. Certificates are blurred, expired or issued to another entity/model.

8. Sample construction differs from the written specification.

5/7

9. Price is far below comparable quotations without a credible cost explanation.

10. The supplier pressures payment before identity or contract questions are resolved.

6/7

One red flag may have an innocent explanation.

Several independent inconsistencies tell me to pause, document and verify before moving forward.

7/7

Databases can reveal some inconsistencies early.

They cannot protect a transaction unless the buyer follows through with verification and payment controls.

Post B — Short

A red flag is not a verdict.

It is a reason to raise the evidence threshold.

I try to investigate inconsistencies without explaining them away—or turning every anomaly into an accusation.

Post C — Engagement

Which supplier red flag would make you stop immediately rather than investigate further?

Day 47 — Three different records

Post A — Short + comparison visual

I separate three things buyers often blend together:

1. Business registration identifies the legal business.

2. Customs registration relates to an exporter/import-export record or regulatory context.

3. Product certification/test evidence relates to a defined product and standard.

One does not substitute for another.

Post B — Short

A company can be legally registered and still lack the product evidence your market requires.

A product report can be genuine and still belong to another model or entity.

Verification must match the exact question.

Post C — Quiz

Which document proves a product complies with your target market?

Trick answer: no document title alone proves it.

You must check issuer, standard, scope, model, date and legal entity.

Day 48 — What exhibition history does not prove

Post A — Short

A long exhibition history can support a story of market participation.

It does not prove:

- Current capacity
- Factory ownership
- Quality consistency
- Financial health
- Fit for your product

I use history to shape questions, not skip them.

Post B — Short

The more impressive a supplier signal sounds, the more precisely I define it.

“Ten years of exhibition records” is useful.

“Ten-year verified factory” is a different—and unsupported—claim.

Post C — Engagement

Would repeated trade-fair participation make you more likely to contact a supplier?

What would you verify immediately afterward?

Day 49 — Why I do not sell personal contact data

Post A — Founder post

I chose not to build GoCNScout or BamwoodChina around personal phone numbers and email addresses.

I want the products to help buyers research companies, products and public business signals—not become another source of stale or intrusive contact lists.

It narrows the product. It also makes the value proposition cleaner.

Post B — Short

The contact field is not the same as the company.

People change roles. Mailboxes expire. Personal details create privacy and data-quality problems.

I would rather help a buyer identify the right entity and official channel.

Post C — Engagement

What company-level field is more valuable to you than a scraped personal email?

Website, product evidence, location, legal identity, trade history—or something else?

Day 50 — Building a bamboo/wood shortlist

Post A — Thread

1/7

Here is the exact sequence I would use to build a bamboo or wood exporter shortlist.

The database is step three—not step one.

2/7

Step 1: Define the product.

Material, construction, dimensions, finish, intended use and target market.

3/7

Step 2: Define commercial constraints.

MOQ, annual volume, customization, target lead time and packaging requirements.

4/7

Step 3: Search BamwoodChina by product category, material and source description.

Use customs district as a research dimension, not a factory-location shortcut.

5/7

Step 4: Check current identity and product evidence elsewhere.

The source record creates a candidate. Current evidence keeps it on the list.

6/7

Step 5: Ask qualification questions and compare responses against the written brief.

Then select companies for samples and deeper verification.

7/7

A shortlist is not “the first 20 rows.”

It is the result of explicit inclusion and exclusion rules.

[BamwoodChina database or inquiry URL]

Post B — Short

If I cannot explain why a company is on the shortlist, it should not be there.

Every candidate needs a product-fit reason and a list of unresolved questions.

Post C — Engagement

Would you prefer a shortlist to include:

- A. More companies
- B. Fewer companies with research notes

I’m designing for B.

Day 51 — Five uses for structured supplier data

Post A — Thread

1/6

Five practical ways I see sourcing teams using structured supplier data.

Only one of them is “find company names.”

2/6

1. Map a product to likely manufacturing cities.

This makes the first search more focused and can reveal alternative clusters.

3/6

2. Build a consistent longlist.

Apply the same product, region and company-field questions across candidates.

4/6

3. Compare public signals.

Website availability, company type, product descriptions and history can expose questions worth investigating.

5/6

4. Organize team research.

Save, compare and export candidates instead of losing context across tabs and spreadsheets.

5. Produce category intelligence and reports.

6/6

The database does not approve suppliers.

It makes the research process more structured, repeatable and auditable.

[GoCNScout database URL]

Post B — Short

The most valuable database feature for a team may be shared research context—not another search box.

Why was this company saved? What remains unverified? Who checked it?

Post C — Engagement

Which workflow matters most to your team?

- Search
- Compare
- Saved lists
- CSV export
- Category reports

Day 52 — Revisit the winning chart

Post A — Updated visual caption

This was the most discussed data topic from my first 50 days, so I rebuilt the chart with clearer labels and a stronger caveat.

It shows **[insert winning topic and exact metric]** in the current dataset.

It does not show production capacity or supplier quality.

[Attach updated version of the best-performing chart]

Post B — Short

I learned that a useful data post needs two things:

One conclusion the reader can act on.

One limitation that prevents overinterpretation.

Post C — Engagement

What question does this updated chart still leave unanswered?

The best reply may become the next analysis.

Day 53 — A furniture CSV is not a shortlist

Post A — Short

I have thousands of furniture-related exporter records.

That does not mean I have thousands of relevant suppliers for your chair, cabinet or hotel project.

A broad CSV is raw research material. A shortlist requires product-level criteria and current evidence.

Post B — Short

The difference between a data pack and a shortlist:

Data pack: a defined category export.

Shortlist: candidates selected against your brief, with reasons and open questions.

They should not be priced or described as the same product.

Post C — Engagement

What would make a furniture shortlist worth paying for?

Specific product match, website research, compliance notes, MOQ fit, regional clustering—or something else?

Day 54 — Discovery vs verification

Post A — Short

Supplier discovery and supplier verification are different jobs.

Discovery asks: who might fit?

Verification asks: what can I prove about identity, capability and risk now?

I built the databases for the first job while supporting a more disciplined path to the second.

Post B — Short

The danger is treating a good discovery signal as completed verification.

A relevant product record gets a company onto my longlist. It does not get the company a purchase order.

Post C — Poll

Where does your sourcing process lose the most time?

- Discovery
- Qualification
- Samples
- Verification
- Negotiation

Day 55 — Twelve fields I want

Post A — Thread

1/7

Twelve fields I want before deciding whether to contact a supplier—and why no single database has all of them perfectly.

2/7

1. Legal company name
2. Product description
3. City and province
4. Company type

These help me establish basic fit and identity.

3/7

5. Official website
6. Relevant public history
7. Business scope
8. Stable registration identifier

These create cross-checking paths.

4/7

9. Process capability
10. Current certifications/test evidence
11. Capacity and lead-time assumptions
12. Audit or inspection evidence

These usually require current supplier engagement or independent work.

5/7

GoCNScout provides structured public research fields across multiple industries.

BamwoodChina provides a narrower exporter dataset with product, material, customs district and registration fields.

6/7

Neither should pretend to know current operational facts it has not verified.

I want the interface to make missing evidence visible.

7/7

Which three fields would you rank highest before first contact?

Your answer will influence what I enrich next.

Post B — Short

I separate “database fields” from “transaction evidence.”

The first helps me choose whom to investigate.

The second helps me decide whether and how to buy.

Post C — Engagement

Pick only three:

Legal identity, website, city, product evidence, company type, trade history, certification, capacity, audit.

Which three come first?

Day 56 — What performed and why

Post A — Founder review

I reviewed the first eight weeks of posts.

The useful metric was not likes. It was the number of specific sourcing questions, profile visits and product-level conversations each topic created.

My current winners are **[insert three real winning series]**. I'll publish more of those and retire formats that produced only shallow reach.

Post B — Short

I would rather have ten replies naming real products than a thousand impressions from people who will never source anything.

Audience relevance changes how I judge content.

Post C — Engagement

Which series should stay?

- Product-to-city maps
- Due-diligence frameworks
- Bamboo/wood exporter data
- Building the databases in public

Day 57 — What GoCNScout readers asked

Post A — Thread

1/6

After nearly 60 days of writing about China supplier research, these are the GoCNScout questions I heard most often.

[Replace the following categories with actual audience feedback before publishing.]

2/6

“Which city should I search for this product?”

This is why I’m expanding product-to-city and industry-cluster analysis.

3/6

“How do I know whether the company is a factory?”

My answer remains: use multiple signals, then verify the operating model directly.

4/6

“How current is the information?”

I need to make source dates, updates and field provenance more visible—not hide them behind a quality claim.

5/6

“Can I export and compare candidates?”

That tells me buyers want a workflow, not just public profile pages.

6/6

The next product decisions will come from these questions.

Try the current database and tell me where the research still feels slow.

[GoCNScout database URL]

Post B — Short

The best product feedback is usually phrased as work:

"I still have to open 30 tabs."

"I cannot tell why these records match."

"I need to share this shortlist with my team."

That is what I listen for.

Post C — Engagement

If you could remove one manual step from supplier research, what would it be?

Day 58 — What bamboo and wood buyers asked

Post A — Thread

1/6

BamwoodChina started as a vertical database idea.

The most useful feedback has been about what buyers need after finding an exporter record.

[Replace these observations with actual feedback before publishing.]

2/6

Buyers want narrower product matches—not one enormous "wood products" list.

That supports smaller packs and custom shortlists.

3/6

They want a path to current company evidence.

A registration record is valuable, but website and operating research determine whether the candidate moves forward.

4/6

They need clear field definitions.

Customs district, factory location, registration and certification cannot be blended together.

5/6

They care about process-specific questions: moisture, coatings, adhesives, construction and packaging—not just material labels.

6/6

My next BamwoodChina offer will follow the strongest real demand, not the largest category count.

Which product should be first?

Post B — Short

I am not choosing the first BamwoodChina data pack by database size.

I am choosing it by buyer urgency, product specificity and whether the current fields can support a useful decision.

Post C — Engagement

If you are actively buying bamboo or wood products, reply with:

Product + country + approximate order size.

That is more useful than a vote from someone outside the market.

Day 59 — What 34,000+ records can tell me

Post A — Thread

1/7

What can more than 34,000 public Chinese exporter and exhibitor records actually tell a buyer?

Less than marketing copy often promises—and more than an unstructured search reveals.

2/7

They can help identify companies connected to products, industries, cities, exhibitions, customs districts and other public fields in the source data.

3/7

They can reveal patterns:

- Geographic concentration
- Category density
- Website coverage
- Repeated public history
- Alternative companies to investigate

4/7

They can make longlist research more consistent and easier to share.

That is real operational value.

5/7

They cannot prove current capacity, factory ownership, product quality, certification validity or transaction safety without additional evidence.

6/7

GoCNScout uses broad multi-industry records for supplier discovery.

BamwoodChina uses a focused plant-based exporter dataset for product and registration research.

7/7

My promise is not “trust this supplier.”

It is “start with a better research set, understand the evidence and know what to verify next.”

[Links to both product introductions]

Post B — Short

After 60 days, my clearest product principle is this:

Supplier intelligence should make uncertainty visible.

It should not hide uncertainty behind a score or badge.

Post C — Engagement

Would you rather a database give you:

A. One simple supplier score

B. Separate evidence fields and limitations

I’m building for B.

Day 60 — What comes next

Post A — Founder summary

For 60 days, I wrote about Chinese manufacturing clusters, exporter records, supplier screening and the limits of public data.

The next phase will focus on the formats that created real sourcing conversations: **[insert verified winning series]**.

I’m continuing to build GoCNScout for broad discovery and BamwoodChina for focused bamboo/wood/plant-based exporter research.

Thanks to everyone who challenged the assumptions and shared a real product brief.

Post B — Short

I’m keeping one rule for the next 60 days:

Publish fewer generic sourcing tips.

Publish more original data, specific product examples and honest explanations of what the evidence cannot prove.

Post C — Engagement

What should I continue every week?

- China product-to-city maps
- Supplier due-diligence breakdowns
- Bamboo/wood category research
- Building the databases in public

Reply with one—and the product you work with.

Final publishing checklist

Before scheduling each day:

1. Replace every square-bracket instruction with a current URL, verified category or real performance result.
2. Recalculate every database count and chart from the latest production data.
3. Add UTM parameters to product links.
4. Attach visuals only when the chart has a title, metric, source scope and date.
5. Do not publish retrospective claims about audience feedback until real feedback supports them.
6. Read the post aloud once. Remove phrases you would not naturally say in a conversation.
7. Keep replies human. Do not paste the same response under multiple accounts.
